                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pathway: blood coagulation moderation
Note: the membrane-bound form is located on the endothelium luminal surface of arterie
Note: thrombin complexed with the membrane-bound form is subject to endocytosis
Superfamily: thrombomodulin; C-type lectin homology, EGF homology
Keywords: anticoagulant; beta-hydroxyasparagine; beta-hydroxyaspartic acid; blood coag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A; Description: inhibits thrombin activation of fibrinogen; cofactor for thrombin activat
                                                                                                                                                        A; Molecule type: protein
A; Residues: 475-491,'X',493-494 <GER>
A; Note: the residue designated 'X' was determined to be a Ser with covalently bound chon

pirl:* pir2:* pir3:* pir4:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                 1 MLGVLVLGALALAGLGFPAPAEPQPGGSQCVEHDCFALYPGPATFLNASQICDGLRGHLM 60
                                                                                            Protein is encoded by plasmid p2.1 derived from human cell line A549 known to express about 10000 molecules of thrombomodulin per cell. Plasmid p2.1 showed a strong hybridisation signal with a 60-mer bovine-thrombomodulin probe. Thrombomodulins are used to potentiate a patient's anticoagulant capacity. See also AAN82027 and AAN82037.
        Recombinant protein having thrombomodulin activity - used in the therapeutic control of coagulation and the treatment and prevent of thrombotic episodes
                                                                                                                                                                                                                                                        ö

The sequence was deduced DNA obtd. from clone GHTWAN isolated from a human chromosome 20 library, subcloned into pUC19 to give pGHTWAN. A PPU MI fragment of this cector was ligated with a linker to construct pUC18TW, which was traated with BsmI to delete about 500 bp from the 3' end of the gene. ( The deletion occurs at the Ser/Thr-rich/transmenbrane domain junction, effectively cleaving the transmembrane and cytoplasmic commanns.) The plasmid was recircularised to give pUC18TWD for use in prodn of the recombinant sol. deriv. The protein reacts with thrombin to activate the Protein C anticoagulant pathway, inhibit thrombin, and can be used to treat or prevent thrombotic disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a human thrombomodulin protein. The invention relates to a treating agent for vasculitis containing a peptide which promotes activation of protein C by thrombin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        plasmid M13TWD1 (see AAR22016) encoding the first 516 N-terminal amino acids of human thrombomodulin was used as a template for site-directed mutagensis using the "TWM1 mutator" to produce plasmid M13TWM1. In the mutant thrombomodulin encoded by the plasmid, the wild-type Asp residue at position 367 is substituted by an Ala residue. This mutant, truncated thrombomodulin has low activity in the activation of protein C, c.f. high activity for the similarly truncated thrombomodulin with Asp 367.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GAWDCSVENGGCEHACNAIPGAPRCQCPAGAALQADGRSCTASATQSCNDLCEHFCVPNP

The present invention describes a method for maintaining the quality of an aqueous parenteral solution of thrombomodulin comprising buffer and surfactuant assptically filled in a case or syringe, Maintaining the quality of an aqueous, parenteral thrombomodulin solution is characterised in that the solution: (a) comprises soluble thrombomodulin, a buffer to maintain the pH at 5.7 and a surfactant; (b) is aseptically filled into: (i) a case or (ii) a syringe without any empty space; and (c) is kept in liquid form in storage and distribution and not frozen or freeze dried. Thrombomodulin is used to treat acute coronary syndrome freeze dried. Thrombomodulin is used to treat acute coronary syndrome or sesel thrombosis (e.g. cerebral, vascular and peripheral blood vessel thrombosis), embolism, peripheral blood vessel disorders (e.g. Raynaulus disease), arteriossis, vasculitis (e.g. due to systemic lupus erythematosus or Barrett's syndrom;) multiple organ failure, disseminated intravascular coagulation, transient ischemala, diabetes, liver veno-occlusive diseases and deep vein thrombosis. The composition ready to use form avoiding the problems of dissolution and accuracy when preparing on demand. The present sequence represents human

The invention relates to the design, production and use of thrombomodulin (TM) analogues that have the ability to enhance the thrombin-mediated activation of protein c which have a significantly reduced ability to promote activation of thrombin-activatable fibrinolysis inhibitor (TAFI).

The analogue is useful for treating thrombotic disease in human, by administering it or a polynucleotide encoding it to the patient and expressing the analogue in vivo. Composition comprising TM analogue is useful for treating a thrombotic disease or condition in mammals. TM analogue is useful in antithrombotic therapy. TM analogue is also useful for treating diseases in which thrombus formation plays a significant intraction diseases in which thrombus formation plays a significant intraction diseases in which thrombus formation is also useful for treating diseases in which thrombus formation is septic shock, bulmonary embolism, acute respiratory disorders including coronary or useful for treating various circulatory disorders including coronary or pulmonary embolism, stroke and systemic coagulation disorders including coronary or bulmonary embolism, stroke and systemic coagulation disorders including coronary or travamina of pregnancy. The present sequence is human full-length native
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 TVRSSVAADVISLLLNGDGGVGRRRLWIGLQLPPGCGDPKRLGPLRGFQWVTGDNNTSYS 120

In the mutant thrombomodulin encoded by the plasmid, the wild-type Asp residue at position 367 is substituted by an Glu residue. The activity of this mutant, truncated thrombomodulin (i.e. D123Glu) in the activation of protein C was compared to that of similarly truncated thrombomodulin (i.e. D123Asp). The activity of D123Glu was as hig at position 367 (i.e. D123Asp). The activity of D123Glu was as shig as 1.2 times that of D123Asp. See AAR22013-R22022 and AAQ25074.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 aggregation - promotes thrombin catalysed protein C activation for treating myocardial infarction, thrombosis, embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mutant; thrombin binding site; blood clotting; TMm2 mutator.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of using thrombomodulin analogues in the treatment of the neurologic trauma associated with spinal cord injury in mammals. The method involves administering a oxidation resistant, soluble, recombinant thrombomodulin analogue, where the methonine at position 388 has been replaced with a leucine, and the analogue is numbered in accordance with native thrombomodulin. The method and thrombomodulin analogue are useful for treating
   Treating neurological damage resulting from spinal cord injury in humans by administering a soluble, recombinant thrombomodulin analog which is resistant to oxidation

                                                                                                                          In an example, plasmid M13mpl9TMD3 (constructed from pSV2TMJ2 (ATC 67238) config. a human thrombomodulin sequence) was subjected to site directed mutagenesis to prepare pSV2TMD7. Plasmid pSV2TMD7 was transfected to COS-1 cells. The activity of promoting protein Cactivation by thrombin of the peptide produced by the transformed COS-1 cell was measured. The ant. of the peptide was determined.

They can be produced efficiently in pure form by culture of appropriate transformants, and are useful in treatment of circulatory disorders such as myocardial infarction, thrombosis, embolism, telangiemphraxis, arteriosclerosis obliterans, disseminated intravascular coagulation, angina pectoris, gestosis and transient ischaemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           į.s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RWARLDLNGAPLCGPLCVAVSAAEATVPSEPIWEEQQCEVKADGFLCEFHFPATCRPLAV

c-terminal= 36 amino acids). Additionally it has an N-terminal signal sequence and an attached sugar chain, contg. chondroltin or chondroltin sulphate. It promotes the activation of protein C by thrombin and has good anticoagulant, platelet aggregation inhibition and thrombolytic activities. It can therefore be used for treating cardiovascular diseases, eg arteriosclerosis or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360

The invention relates to a treating agent for vasculitis containing a peptide which promotes activation of protein C by thrombin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180

The invention relates to a novel method for the preparation of highly pure soluble thrombomodulin (TM) containing substantially no serumderived or antibody-derived substance. The method comprises isolating soluble TM from unpurified serum via affinity purification using an anti-TM antibody. The soluble TM is then treated with with a cation exchanger at a specific conductivity of 25 to 34 ms/cm and a pH of 3 to 4, and the fraction containing the soluble TM is isolated. The soluble TM can be used as a blood anticoagulation agent and a thrombolytic agent.

Plasmid Mi3mp19TMJ3 (see AAR22013) was used as template for site-directed mutagenesis. A 177bp fragment was deleted using the "TMG1 deleter" oligonucleotide to give plasmid Mi3TMD1 which encodes the first 516 N-terminal amino acids of human thrombomodulin. Plasmid Mi3TMD1 was completely digested with HindIII and BamHI and a TMD1 fragment of ca. 1700bp was isolated. The fragment was ligated to HindIII- and BglII-cut plasmid pSV2-dhfr to give the recombinant plasmid pSV2TMD1. See AAR22014-R22022 and AAQ25072.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     480

The present invention describes a method for maintaining the quality of an aqueous parenteral solution of thrombomodulin comprising buffer and surfactural asseptically filled in a case or syringer. Maintaining the quality of an aqueous, parenteral thrombomodulin solution is characterised in that the solution: (a) comprises soluble thrombomodulin, in that the solution: (a) comprises soluble thrombomodulin, a buffer to maintain the pH at 5-7 and a surfactant; (b) is asseptically filled into: (1) a case or (ii) a syringe without any empty space; and (c) is kept in liquid form in storage and distribution and not frozen or freeze dried. Thrombomodulin is used to treat acute coronary syndrome (such as myocardial infarction, unstable angina and coronary artery blockage), thrombosis (e.g. cerebral, vascular and peripheral blood vessel thrombosis, embolism, peripheral blood vessel disorders (e.g. Raynaulds disease), arteriosclerosis, vasculitis (e.g. due to systemic lupus erythematosus or Barrett's syndrome), multiple organ failure, disseminated intravascular coagulation, transient ischaemia, diabetes, liver veno-occlusive diseases and deep vein thrombosis. The composition is stable for a long period of time and can be stored and distributed in preparing on demand. The present sequence represents human thrombomodulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TVRSSVAADVISLLLNGDGGVGRRRLWIGLQLPPGCGDPKRLGPLRGFQWVTGDNNTSYS 120

Title:

```
New polypeptide inhibits blood coagulation and platelet aggregation - promotes thrombin catalysed protein C activation for treating myocardial infarction, thrombosis, embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Truncated human thrombomodulin encoded by plasmid pSV2TMD1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matsuda A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ŏ
                                                                        an aqueous parenteral solution of thrombonodulin comprising buffer and surfactant aseptically filled in a case or syringe. Maintaining the quality of an aqueous, parenteral thrombomodulin solution is characterised in that the solution: (a) comprises soluble thrombomodulin, a buffer to maintain the pH at 5-7 and a surfactant; (b) is aseptically filled into: (i) a case or (ii) a syringe without any empty space; and (c) is kept in liquid form in storage and distribution and not frozen or freeze dried. Thrombomodulin is used to treat acute coronary syndrome (such as mycorafdal infarction, unstable angina and coronary artery blockage), thrombosis (e.g. cerebral, vascular and peripheral blood vessel thrombosis), embolism, peripheral blood vessel thrombosis), arteriosclerosis, vasculitis (e.g. due to systemic lupus erythematosus or Barrett's syndrome), multiple organ failure, disseminated intravascular coagulation, transient ischaemia, diabetes, liver veno-occlusive diseases and deep vein thrombosis. The composition is stable for a long period of time and can be stored and distributed in ready to use form avoiding the problems of dissolution and accuracy when thrombomodally.
                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                               present invention describes a method for maintaining the quality of

301 AAY09347 g g à 셤 ò ð ö Plasmid Mi3mpl9TMJ3 (see AAR22013) was used as template for site-directed mutagenesis. A 177bp fragment was deleted using the "TMd1 deleter" oligonucleotide to give plasmid Mi3TMD1 which encodes the first 516 N-terminal amino acids of human thrombomodulin. Plasmid Mi3TMD1 was completely digested with HindIII and BamHI and a TMD1 fragment of ca. 1700bp was isolated. The fragment was ligated to HindIII- and BglII-cut plasmid pSV2-dhfr to give the recombinant plasmid pSV2TMD1. See AAR22014-R22022 and AAQ25072. 240 DQPGSYSCMCETGYRLAADQHRCEDVDDCILEPSPCPQRCVNTQGGFECHCYPNYDLVDG 360 TVRSSVAADVISLLLNGDGGVGRRRLWIGLQLPPGCGDPKRLGPLRGFQWVTGDNNTSYS 120 RWARLDLNGAPLCGPLCVAVSAAEATVPSEPIWEEQQCEVKADGFLCEFHFPATCRPLAV 180 240 GAWDCSVENGGCEHACNAIPGAPRCQCPAGAALQADGRSCTASATQSCNDLCEHFCVPNP 300 Gaps **EPGAAAAVSITYGTPFAARGADFQALPVGSSAAVAPLGLQLMCTAPPGAVQGHWAREAP** ö New polypeptide inhibits blood coagulation and platelet aggregation - promotes thrombin catalysed protein C activation for treating myocardial infarction, thrombosis, embolism, etc. Query Match 99.9%; Score 2912; DB 13; Length 516; Best Local Similarity 99.8%; Pred. The present invention describes a method for maintaining the quality of an aqueous parenteral solution of thrombomodulin comprising buffer and surfactant aseptically filled in a case or syringe. Maintaining the quality of an aqueous, parenteral thrombomodulin solution is characterised in that the solution: (a) comprises soluble thrombomodulin, characterised in that the solution: (a) comprises soluble thrombomodulin, a buffer to maintain the pH at 5-7 and a surfactant; (b) is aseptically filled into: (l) a case or (ii) a syringe without any empty space; and (ii) a kept in liquid form in storage and distribution and not frozen or freeze dried. Thrombomodulin is used to treat acute coronary syndrome (such as myocardial infarction, unstable angina and coronary artery blockage), thrombosis, embolism, peripheral blood vessel thrombosis, embolism, peripheral blood vessel thrombosis, embolism, peripheral blood vessel disorders (e.g. Raynaulds disease), arteriosclerosis, vascular and peripheral blood vessel thrombosis), anteriosclerosis, wascularis (e.g. due to systemic lupus erythematosus or Barrett's syndrome), multiple origan failure, disseminated intravascular coaquiation, transient ischaemia, diabetes, liver veno-occlusive diseases and deep vein thrombosis. The composition ready to use form avoiding the problems of dissolution and accuracy when thrombomodulin.

The invention relates to a novel method for the preparation of highly pure soluble thrombomodulin (TM) containing substantially no serumderived or antibody-derived substance. The method comprises isolating soluble TM from unpurified serum via affinity purification using an anti-TM antibody. The soluble TM is then treated with with a cation exchanger at a specific conductivity of 25 to 34 ms/cm and a pH of 3 to 4, and the fraction containing the soluble TM is soluble TM is soluble TM soluble TM is soluble TM sequence represents a blood anticoagulation agent and a thrombolytic agent. This sequence represents a human thrombomodulin variant, designated SEQ ID NO:3.

This human thrombomodulin polypeptide comprises a 115 residue active fragment with opt. flanking sequences (N'terminal= 34 amino acids). Additionally it has an N-terminal signal sequence and an attached sugar chain, contg. chondroitin or chondroitin sulphate. It promotes the activation of protein C by thrombin and has activities. It can therefore be used for treating cardiovascular diseases, eg arteriosclerosis or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       360

                                                                                                                                                                                                                                                                           Transformation; fungus; blood coagulation; prevention; platelet; aggregation; thrombolytic activity; thrombolysis; human thrombomodulin; site-directed mutagenesis; promotion; protein C; activation; thrombin.
Novel polypeptides, obtd. by culturing transformed fungus, have blood coagulation preventing, platelet aggregation preventing and thrombolytic activities.

In an example, plasmid Mismpl9FWD3 (constructed from pSV2TWJ2 (ATCC 67238) contg. a human thrombomodulin sequence) was subjected to site directed mutagenesis to prepare pSV2TWD7. Plasmid pSV2TWD7 was transfected to COS-1 cells. The activity of promoting protein C activation by thrombin of the peptide produced by the transformed COS-1 cell was measured. The amt. of the peptide was determined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RWARLDLNGAPLCGPLCVAVSAAEATVPSEPIWEEQQCEVKADGFLCEFHFPATCRPLAV 180

They can be produced efficiently in pure form by culture of appropriate transformants, and are useful in treatment of circulatory disorders such as myocardial infarction, thrombosis, embolism, telangiemphraxis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of using thrombomodulin analogues in the treatment of the neurologic trauma associated with spinal cord injury in mammals. The method involves administering a oxidation resistant, soluble, recombinant thrombomodulin analogue, where the methionine at position 388 has been replaced with a leucine, and the analogue is numbered in accordance with native thrombomodulin. The method and thrombomodulin analogue are useful for treating neurological damage resulting from spinal cord injury in human. The present sequence is human thrombomodulin protein.

administering it or a polynucleotide encoding it to the patient and administering it or a polynucleotide encoding it to the patient and attressing the analogue in vivo. Composition comprising TM analogue is useful for treating a thrombotic disease or condition in mammals. TM analogue is useful in antithrombotic therapy. TM analogue is also useful for treating diseases in which thrombus formation plays a significant circledical role including myocardial infarction, disseminated intravascular coagulation (DIC), deep vein thrombosis, septic shock, pulmonary embolism, acute respiratory distress syndrome, unstable angina and other arterial or venous occlusive conditions. TM analogue is also useful for treating various circulatory disorders including coronary or pulmonary embolism, stroke and systemic coagulation disorders including DIC which is often associated with septicaemia, certain cancers and toxaemia of pregnancy. The present sequence is human full-length native
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of a sol. thrombomodulin deriv. comprising the signal peptide (optional), N-terminal, epidermal growth factor homology region and the Ser/Thr-rich region, but lacking the transformed region and the Ser/Thr-rich region, but lacking the transformed region and the Ser/Thr-rich region, but lacking the transformed region and the sequence was deduced but obtd. From clone GHTW3A isolated from a human chromosome 20 library, subcloned into pucig to give pGHTW3A. A PPU MI fragment of this vector was ligated with a linker to construct pucinswift was treated with BsmI to delete about 500 bp from the 3' end of the gene. ( The deletion occurs at the Ser/Thr-rich/transmembrane domain junction, effectively cleaving the transmembrane and cytoplasmic domains.) The plasmid was recircularised to give pucilTHWD for use in prodn of the recombinant sol. deriv. The protein reacts with thrombin to activate the Protein C anticoagulant pathway, inhibit thrombin, and can be used to treat or prevent thrombotic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DQPGSYSCMCETGYRLAADQHRCEDVDDCILEPSPCPQRCVNTQGGFECHCYPNYDLVDG 360

Plasmid p2.1 showed a strong hypridisation signal with a 60-mer bovine thrombomodulin probe. Thrombomodulins are used to potentiate a patient's anticoagulant capacity. See also AAN82027 and AAN82037.

In the mutant thrombomodulin encoded by the plasmid, the wild-type Asp residue at position 367 is substituted thrombomodulin (1.e. D123Glu) in the activation of protein C was compeared to that of similarly truncated thrombomodulin with Asp at position 367 (i.e. D123Asp). The activity of D123Glu was as high as 1,2 times that of D123Asp. See AAR22013-R22022 and AAQ25074.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

F.177-199/Region: PEST sequenc
                                                                                                                                                                                A. Molecule type: protein
A. Molecule type: protein
A. Molecule type: protein
A. Residues: 475-491, X', 493-494 <GER>
A. Residues: 475-491, X', 493-494 <GER>
A. Note: the residue designated 'X' was determined to be a Ser with covalently bound chort R. Molinger, D.P.; Komives, E.A.
Submitted to the Brookhaven Protein Data Bank, September 1995
